1. Overview

Status: Draft — ready for review **Segment:** Customer-facing tutorial (neoStampa). Most directly useful for Existing Customers running production queues; also relevant to Printer-Brand/Distributor Partners supporting their own customers on this screen. **Product:** neoStampa — Printing Job Queue (part of the Print Server component) **Brand color:** neoStampa Blue #0072CE — used for every on-screen UI-highlight callout (circles, glow rings, arrows) briefed below. **Estimated runtime:** 7:30–8:00 minutes **Follow-up to:** “*What Is Print Server? A Beginner’s Guide*” — that video covers the queue at a concept level. This one is the hands-on continuation: every toolbar button, the Process/Send workflow, the right-click menu, and Queue Settings, in the order someone would actually click through them. **Goal:** Someone who already knows *what* the queue is can sit down at the actual queue window and confidently use every control in it — start/stop the queue, choose the right Process/Send mode for a job, reorder and manage jobs, and configure Queue Settings — without hunting through documentation. **Scoreboard link:** Supports existing-customer upgrade rate (reduces support-ticket friction on a screen customers use daily) and newsletter → trial click-through (a “here’s how deep the software goes” piece for trial users deciding whether to convert). **Source:** neoStampa’s Printing Job Queue support article — inedit.freshdesk.com/en/support/solutions/articles/14000138790

Open flags — read before this script is treated as final

1. **“Process and Send Simultaneously” needs SME/support confirmation.** The source support article does not use this exact phrase — it describes three Process/Send variations: *Process Only*, *Process and Send*, and *Send* (see Section 2). This script treats “Process and Send Simultaneously” as plain-language for **Process and Send** (processing and sending as one combined action, instead of two separate steps). An alternative reading — the queue *processing one job while simultaneously sending a different, already-processed job* (true pipeline overlap) — is plausible for a production queue but is **not described in the source article**, and is not claimed as confirmed behavior anywhere in this script. If that pipeline-overlap behavior is real, it needs SME/support confirmation, and ideally a screen recording showing two jobs at different stages simultaneously (“Processing” and “Printing”) to demonstrate it honestly.
2. **Runtime (7:30–8:00) is well over the usual 2–4 minute tutorial target**, by design — the brief was to cover all 18 toolbar buttons, the 3 Process/Send modes, the right-click menu, and Queue Settings in one reference walkthrough. Two options: publish as one video with YouTube chapter markers, or split into **Part 1 — Process/Send modes** (short) and **Part 2 — Toolbar + Settings reference** (longer). Left open for review, not decided here.
3. **No screen-capture footage exists yet.** This script and brief describe what to record; nothing here is a finished visual asset. A dedicated recording session against a live, non-production neoStampa queue is required before this moves toward **outputs/**.
4. **Advanced Options’ exact UI location is unconfirmed** — the source article lists Length Mode, Bi-directional Print, Cut Sheet at the End, and Origin Setup under “Advanced Options,” but doesn’t say whether that’s inside Queue Settings, a separate dialog, or per-job. Verify against the live software before recording that scene.
5. **Final CTA link (trial vs. demo vs. support article) is unconfirmed** — same open item as the earlier Print Server intro video.
6. **Exact on-screen button labels, icon glyphs, and dialog field names are not fabricated in this script.** The source article names each button’s function, not always its precise tooltip text — capture the real on-screen wording from a live recording rather than retyping from this document.

2. Full Video Script

Timestamped script — visuals, on-screen text, and voiceover for each scene.

Scene 1 — 0:00–0:20 — Cold Open

Visual: Screen recording of the queue window with 5–6 jobs listed in different states (waiting, processing, printing, paused, error). Inèdit logo bug, bottom corner.

Voiceover: “This is neoStampa’s Printing Job Queue — and if you’ve watched our Print Server overview, you already know what it’s for. This time, we’re going hands-on: every button on this toolbar, what it does, and when to use it.”

On-screen text: “The Printing Job Queue — full walkthrough”

Scene 2 — 0:20–0:50 — Orientation

Visual: Slow pan across the full queue window — job list in the center, toolbar along the top (18 buttons), right-click menu briefly flashed and dismissed as a preview.

Voiceover: “Two things to orient on before we start clicking. The job list in the center shows every job you’ve queued, with its current status. And the toolbar across the top — eighteen buttons — is everything you can do to a job or to the queue itself. Right-clicking any job gives you most of the same options in a context menu, which we’ll come back to at the end.”

On-screen text: “Job list · Toolbar (18 buttons) · Right-click menu”

Scene 3 — 0:50–2:30 — Process / Send: the three modes

Visual: Select a waiting job, click Process/Send, and show the flyout/dialog with its options. Walk through each of the three in turn, showing the copy-quantity field for Process and Send, and the “redirect to file” option for Send. Use neoStampa-blue highlight rings on whichever option is being described.

Voiceover:

“Let’s start with the decision you’ll make on almost every job: how do you get it from the queue to the printer? Select a job and open **Process/Send**, and you’ll see three options.”

On-screen text: “(1) Process Only”

“**Process Only** prepares the job — rasterizing it, applying your color and layout settings — but doesn’t send anything to the printer yet. Use this when you want the file ready to go, but you’re not printing this exact second — maybe the printer’s still finishing another job, or you want to review it first.”

On-screen text: “(2) Process and Send”

“**Process and Send** does both in one action — it processes the job and sends it straight to the printer, and lets you set how many copies you want as it goes. This is the one-click option when a job’s ready to print right now, no separate steps needed. If you’ve heard this called ‘process and send simultaneously’ — that’s the same thing: processing and sending happen together, back-to-back, instead of you doing Process Only now and Send later.”

On-screen text: “(3) Send”

“And **Send** is for a job that’s *already* been processed — it transmits the prepared file to the printer, and you can also redirect it to a file instead, saving it to a specific location rather than printing it directly. That’s useful for archiving a print-ready file, or handing it off to another machine.”

On-screen text: “Copy quantity — set how many copies on Process and Send”

Scene 4 — 2:30–2:55 — Buttons 1–2: Queue control

Visual: Click button 1 (Activate queue), watch a paused/waiting job start moving; then click button 2 (Stop queue), watch it halt. Blue highlight ring on each button as clicked.

Voiceover: “Now the toolbar, left to right. Button one, **Activate queue** — starts the queue processing and printing jobs in order. Button two, **Stop queue** — halts the whole queue. Use Stop when you need to pause everything, not just one job — a paper change, a maintenance check, anything that affects the printer itself.”

On-screen text: “(1) Activate queue · (2) Stop queue”

Scene 5 — 2:55–4:00 — Buttons 3–8: Job-level actions

Visual: Click through buttons 3–8 in sequence on a selected job — View job information, Add processed files, Process/Send selected job (quick callback), Pause selected job, Stop printing after current copy, Cancel job. Blue highlight ring on each.

Voiceover: “Button three, **View job information** — opens the details for whichever job is selected: settings it was queued with, file info, status history. Button four, **Add processed files** — lets you bring already-processed PRN or PLT files straight into the queue, skipping the processing step entirely because the work’s already done. Button five is **Process/Send selected job** — the same three-option menu we just walked through, available right here on the toolbar for whichever job you’ve selected. Button six, **Pause selected job** — holds just that one job without touching the rest of the queue. Button seven, **Stop printing after current copy** — if you’ve queued multiple copies of one job and need to stop, this finishes the copy currently printing instead of cutting it off mid-print, so you’re not left with a half-printed piece. And button eight, **Cancel job** — stops it outright.”

On-screen text: “(3) View job information · (4) Add processed files (PRN, PLT) · (5) Process/Send · (6) Pause selected job · (7) Stop after current copy · (8) Cancel job”

Scene 6 — 4:00–4:35 — Buttons 9–12: Reordering

Visual: Select a job partway down the list, click each of buttons 9–12 in turn (Move to queue head, Move up, Move down, Move to queue bottom), showing the job’s position changing in the list each time.

Voiceover: “Buttons nine through twelve are all about order. **Move job to queue head** sends it straight to the front — the next thing that’ll print. **Move job up** and **move job down** nudge it one position at a time. And **move job to queue bottom** sends it to the back of the line. If a rush job comes in, this is how you reprioritize without cancelling and requeuing anything.”

On-screen text: “(9) Move to queue head · (10) Move up · (11) Move down · (12) Move to queue bottom”

Scene 7 — 4:35–5:20 — Buttons 13–16: List management

Visual: Select a finished/cancelled job, click Reopen job, watch it return to waiting status. Then click Remove selected jobs on one job, Delete finished jobs with several finished jobs in the list, and Delete all jobs (on a demo/test queue only — call out on screen that this is destructive).

Voiceover: “Buttons thirteen through sixteen manage the list itself. **Reopen job** takes a finished or cancelled job and puts it back to waiting, so you can print it again without setting it up from scratch. **Remove selected jobs** takes specific jobs out of the list. **Delete finished jobs** clears out everything marked done, in one click — handy for keeping a busy queue tidy. And **delete all jobs** — exactly what it sounds like, so use it deliberately. There’s no separate undo here, so double-check your selection first.”

On-screen text: “(13) Reopen job · (14) Remove selected jobs · (15) Delete finished jobs · (16) Delete all jobs”

Caution callout (*neutral warning icon, product-blue button ring kept as-is*): “Delete all jobs cannot be undone”

Scene 8 — 5:20–5:50 — Buttons 17–18: Cost utility & Queue Settings entry

Visual: Click button 17 (Cost calculation utility) — show whatever cost/ink-consumption panel opens. Then click button 18 (Queue settings) — just open the dialog here; full walkthrough is next scene.

Voiceover: “Button seventeen opens the **cost calculation utility** — a quick way to check ink consumption and cost estimates for jobs in the queue, without leaving this window. And button eighteen, the last one, opens **Queue settings** — the configuration panel for how the queue behaves overall. That’s worth its own few minutes, so let’s open it.”

On-screen text: “(17) Cost calculation utility · (18) Queue settings”

Scene 9 — 5:50–6:40 — Queue Settings dialog

Visual: Queue Settings dialog, panning/highlighting each field as it’s named — temporary folder path, Job ID number (editable), auto-start queue on launch (checkbox), include Job ID in output filename (checkbox), retry failed jobs (checkbox/setting), retain processed jobs in queue (checkbox), pause duration between print jobs (numeric field).

Voiceover: “Inside Queue Settings: you can set the **temporary folder** where the queue stores files while it works, edit the **Job ID number** if you need your own numbering scheme, and turn on **auto-start** so the queue begins processing automatically the moment neoStampa launches — useful if this machine runs unattended. You can choose whether the **Job ID** gets included in the output filename, which helps trace a printed file back to its queue entry later. **Retry failed jobs** is worth turning on if you’re printing over a network connection that occasionally drops — instead of a job just failing, it’ll retry automatically. You can also choose to **retain processed jobs** in the queue instead of clearing them, and set a **pause duration between print jobs** if your printer or workflow needs a gap between one job finishing and the next one starting.”

On-screen text: “Temporary folder · Job ID numbering · Auto-start on launch · Include Job ID in filename · Retry failed jobs · Retain processed jobs · Pause between jobs”

Scene 10 — 6:40–7:10 — Advanced Options

Visual: Advanced Options — Length Mode toggle (call out it applies to Rapport prints only), Bi-directional Print option, Cut Sheet at the End setting, Origin Setup (Pre-feed lengthwise / Displacement widthwise) fields.

Voiceover: “A few more settings worth knowing, usually reached from the same area. **Length Mode** applies specifically to Rapport prints — when it’s enabled in the RIP with a generated Rapport document, it lets you set the printout length directly. You’ll also find **Bi-directional Print**, **Cut Sheet at the End** for automatically cutting the material once a job finishes, and **Origin Setup**, which controls unprinted space at the start of a print — pre-feed lengthwise, and displacement widthwise — so your first mark lands exactly where you expect it.”

On-screen text: “Length Mode (Rapport only) · Bi-directional Print · Cut Sheet at the End · Origin Setup (pre-feed / displacement)”

Scene 11 — 7:10–7:30 — Right-click context menu

Visual: Right-click a job in the list, context menu opens showing the same functions in a different arrangement. Briefly highlight that it’s the same toolbar actions, reorganized.

Voiceover: “Last thing — right-click any job, and you’ll get a context menu with the same functions we just covered, just laid out differently. If you already know what a button does from the toolbar, the right-click menu should feel familiar — same actions, faster access without moving your cursor up to the toolbar first.”

On-screen text: “Right-click = same toolbar actions, different layout”

Scene 12 — 7:30–8:00 — Recap & CTA

Visual: Cut to clean title card recap: “The Printing Job Queue — the controls that matter.” Three recap lines appear one at a time. Then end card: Inèdit logo, neoStampa product name, CTA text/URL placeholder.

Voiceover: “So — the toolbar covers three kinds of control: how a job gets processed and sent, where it sits in line, and what happens to it once it’s done. Get comfortable with Process Only, Process and Send, and Send, and the rest of the toolbar is mostly about keeping a busy queue organized. If you want the full written reference, or you’re setting up Queue Settings for the first time, check the link below.”

On-screen text / CTA: “Full support article → [link: neoStampa's Printing Job Queue]” · “Questions? Talk to us → [trial/demo request link - NEEDS CONFIRMATION]”

3. Audio-Only Script (Narration Track)

Extracted for recording/TTS — visuals and on-screen text stripped out. Tone: calm, confident, professional — not salesy. This is a reference-style walkthrough, so pacing can be slightly brisker and more matter-of-fact than a concept/intro video.

[0:00–0:20] This is neoStampa’s Printing Job Queue — and if you’ve watched our Print Server overview, you already know what it’s for. This time, we’re going hands-on: every button on this toolbar, what it does, and when to use it.

[0:20–0:50] Two things to orient on before we start clicking. The job list in the center shows every job you’ve queued, with its current status. And the toolbar across the top — eighteen buttons — is everything you can do to a job or to the queue itself. Right-clicking any job gives you most of the same options in a context menu, which we’ll come back to at the end.

[0:50–2:30] Let’s start with the decision you’ll make on almost every job: how do you get it from the queue to the printer? Select a job and open Process/Send, and you’ll see three options.

Process Only prepares the job — rasterizing it, applying your color and layout settings — but doesn’t send anything to the printer yet. Use this when you want the file ready to go, but you’re not printing this exact second — maybe the printer’s still finishing another job, or you want to review it first.

Process and Send does both in one action — it processes the job and sends it straight to the printer, and lets you set how many copies you want as it goes. This is the one-click option when a job’s ready to print right now, no separate steps needed. If you’ve heard this called “process and send simultaneously” — that’s the same thing: processing and sending happen together, back-to-back, instead of you doing Process Only now and Send later.

And Send is for a job that’s already been processed — it transmits the prepared file to the printer, and you can also redirect it to a file instead, saving it to a specific location rather than printing it directly. That’s useful for archiving a print-ready file, or handing it off to another machine.

[2:30–2:55] Now the toolbar, left to right. Button one, Activate queue — starts the queue processing and printing jobs in order. Button two, Stop queue — halts the whole queue. Use Stop when you need to pause everything, not just one job — a paper change, a maintenance check, anything that affects the printer itself.

[2:55–4:00] Button three, View job information — opens the details for whichever job is selected: settings it was queued with, file info, status history. Button four, Add processed files — lets you bring already-processed PRN or PLT files straight into the queue, skipping the processing step entirely because the work’s already done. Button five is Process/Send selected job — the same three-option menu we just walked through, available right here on the toolbar for whichever job you’ve selected. Button six, Pause selected job — holds just that one job without touching the rest of the queue. Button seven, Stop printing after current copy — if you’ve queued multiple copies of one job and need to stop, this finishes the copy currently printing instead of cutting it off mid-print, so you’re not left with a half-printed piece. And button eight, Cancel job — stops it outright.

[4:00–4:35] Buttons nine through twelve are all about order. Move job to queue head sends it straight to the front — the next thing that’ll print. Move job up and move job down nudge it one position at a time. And move job to queue bottom sends it to the back of the line. If a rush job comes in, this is how you reprioritize without cancelling and requeueing anything.

[4:35–5:20] Buttons thirteen through sixteen manage the list itself. Reopen job takes a finished or cancelled job and puts it back to waiting, so you can print it again without setting it up from scratch. Remove selected jobs takes specific jobs out of the list. Delete finished jobs clears out everything marked done, in one click — handy for keeping a busy queue tidy. And delete all jobs — exactly what it sounds like, so use it deliberately. There’s no separate undo here, so double-check your selection first.

[5:20–5:50] Button seventeen opens the cost calculation utility — a quick way to check ink consumption and cost estimates for jobs in the queue, without leaving this window. And button eighteen, the last one,

opens Queue settings — the configuration panel for how the queue behaves overall. That’s worth its own few minutes, so let’s open it.

[5:50–6:40] Inside Queue Settings: you can set the temporary folder where the queue stores files while it works, edit the Job ID number if you need your own numbering scheme, and turn on auto-start so the queue begins processing automatically the moment neoStampa launches — useful if this machine runs unattended. You can choose whether the Job ID gets included in the output filename, which helps trace a printed file back to its queue entry later. Retry failed jobs is worth turning on if you’re printing over a network connection that occasionally drops — instead of a job just failing, it’ll retry automatically. You can also choose to retain processed jobs in the queue instead of clearing them, and set a pause duration between print jobs if your printer or workflow needs a gap between one job finishing and the next one starting.

[6:40–7:10] A few more settings worth knowing, usually reached from the same area. Length Mode applies specifically to Rapport prints — when it’s enabled in the RIP with a generated Rapport document, it lets you set the printout length directly. You’ll also find Bi-directional Print, Cut Sheet at the End for automatically cutting the material once a job finishes, and Origin Setup, which controls unprinted space at the start of a print — pre-feed lengthwise, and displacement widthwise — so your first mark lands exactly where you expect it.

[7:10–7:30] Last thing — right-click any job, and you’ll get a context menu with the same functions we just covered, just laid out differently. If you already know what a button does from the toolbar, the right-click menu should feel familiar — same actions, faster access without moving your cursor up to the toolbar first.

[7:30–8:00] So — the toolbar covers three kinds of control: how a job gets processed and sent, where it sits in line, and what happens to it once it’s done. Get comfortable with Process Only, Process and Send, and Send, and the rest of the toolbar is mostly about keeping a busy queue organized. If you want the full written reference, or you’re setting up Queue Settings for the first time, check the link below.

4. Screen-Recording & Storyboard Brief

Purpose: unlike a concept video, this tutorial is a hands-on UI walkthrough — it lives or dies on showing the real queue window, the real Process/Send flyout, the real Queue Settings dialog, and the real right-click menu. There is no substitute for actual screen-capture footage. This section spells out the shot list rather than presenting a fabricated mockup storyboard.

Status: blocked on real screen-capture footage. Nothing here is a finished visual asset. No screenshots of the actual queue window, Process/Send dialog, right-click menu, Queue Settings dialog, or cost calculation utility currently exist in the repo for this feature. This needs a dedicated recording session against a live, non-production neoStampa instance before any storyboard or edit can be built.

Why real screen capture, not illustration

This tutorial is a reference walkthrough of eighteen specific toolbar buttons, three Process/Send modes, a right-click menu, and a multi-field settings dialog. The entire value of the video is “here’s exactly what that button looks like and what happens when you click it.” An abstracted mockup of an 18-button toolbar would misrepresent the actual UI (wrong button order, wrong icon shapes, wrong dialog layout) and could teach something incorrect. **Real screen capture is the deliverable for every UI-facing scene.** Title cards, recap screens, and the cold-open split-view can use simple graphic treatment (neoStampa blue #0072CE), but every scene showing a button, menu, or dialog must be real footage.

Record all shots against one continuous demo/test queue session if possible — it keeps job states consistent across shots and avoids re-setup between scenes. Use placeholder job names only (`Job_001.prn`, `SampleFile.plt`, `TestPattern_02.tif`) — no real customer file names, paths, IP addresses, or account info visible anywhere on screen.

Shot list

Scenes 1–2 — Orientation: Full queue window with 5–6 jobs in a mix of statuses (waiting, processing, printing, paused, error) visible simultaneously. Queue several test jobs, deliberately pause one, let one fail (or simulate an error state) so the status column shows real variety. Then a slow, steady pan/zoom across the toolbar (all 18 buttons) and job list, plus a quick flash of the right-click menu appearing and being dismissed.

Scene 3 — Process/Send modes: The Process/Send flyout or dialog opened from a selected waiting job — capture all three options visible (Process Only / Process and Send / Send), then a second take showing the copy-quantity field specifically for Process and Send, and a third showing the “redirect to file” option under Send. Have at least one job in “waiting” (unprocessed) status and one already-processed job available, since Send behaves differently depending on job state.

Scene 4 — Queue control: Click Activate queue on a stopped queue (show a job start moving to Processing/Printing), then click Stop queue (show it halt). Start this shot with the queue in a stopped state.

Scene 5 — Job-level actions: Sequential clicks: View job information (capture the full panel/dialog, not cropped), Add processed files (capture the file picker filtered to .prn/.plt if it is), Process/Send selected job (can reuse Scene 3 footage), Pause selected job, Stop printing after current copy, Cancel job. Queue a job with 3+ copies specified so “stop after current copy” has something meaningful to demonstrate.

Scene 6 — Reordering: Select a mid-list job, click each of Move to queue head / Move up / Move down / Move to queue bottom in sequence, with the list visibly reordering each time. Queue at least 5 jobs so movement is visually obvious.

Scene 7 — List management: Reopen job on a finished/cancelled job (show status flip back to waiting), Remove selected jobs on a single job, Delete finished jobs with 2–3 finished jobs present, Delete all jobs **on the test queue only, at the very end of the session**, since it clears everything. Save Delete all jobs for last in the recording order.

Scene 8 — Cost utility & Queue Settings entry: Cost calculation utility opened from the toolbar — capture full contents; Queue settings dialog opening (contents come in the next scene).

Scene 9 — Queue Settings: Every field visible: temporary folder path, Job ID number, auto-start checkbox, include-Job-ID-in-filename checkbox, retry-failed-jobs setting, retain-processed-jobs setting, pause-duration-between-jobs field. Capture at both default and a couple of fields toggled/edited, so a “before” and “after” state is available for callout animation if needed.

Scene 10 — Advanced Options: Length Mode toggle (ideally with a Rapport-generated document actually loaded, since the article specifies this only applies to Rapport prints), Bi-directional Print option, Cut Sheet at the End setting, Origin Setup fields (pre-feed lengthwise, displacement widthwise). Confirm with an SME where these live in the UI before recording — **open question, don’t assume a location without checking the live software first.**

Scene 11 — Right-click menu: Full context menu visible, ideally with a quick side-by-side or overlay comparison against the toolbar to reinforce “same functions, different layout.”

Scene 12 — Recap: No new capture — reuse the cold-open framing or a clean shot of the full queue window for the recap/end card background.

Redaction checklist (apply before any footage leaves the recording machine)

- Blur or replace any real IP address, hostname, or network path
- Blur or remove any real customer/job file names — use the placeholder names above instead
- Blur any license key, serial number, or account identifier visible in About/status panels
- If the cost calculation utility pulls in real ink pricing or cost data, replace with placeholder numbers before recording, or blur post-capture

Open questions to resolve before this footage is shot (don’t guess these on camera)

1. **Where do Advanced Options (Length Mode, Bi-directional Print, Cut Sheet at the End, Origin Setup) actually live in the UI?** Confirm with an SME or by testing the live software before Scene 10 is recorded.
2. **“Process and Send Simultaneously”** — see Section 1, flag 1. If support/SME confirms this refers to true pipeline overlap, this shot list needs an additional capture: two jobs in the list simultaneously showing different active statuses (“Processing” and “Printing”/“Sending”). Do not stage or fake this without confirming it’s real behavior first.
3. **Exact icon/button visuals** — this brief numbers the 18 buttons in the order given by the source article (left to right), but doesn’t assume anything about their glyphs. Capture them as they actually appear; check the script’s callout numbering against reality before final edit.

Once footage exists

With real screen-capture in hand, the next step is either direct video editing against the script’s timing, or a design pass that composites the real screenshots with blue #0072CE highlight rings/arrows per scene. Don’t generate illustrated mockups of the toolbar/dialogs as a stand-in — for this video, that would misinform rather than help.

5. Source Files in the Repository

This PDF was compiled from the following draft files (still in draft status, per repo convention, until reviewed and moved to `outputs/`):

- `05-tutorials/video-scripts/print-queue-management-script.md`
- `05-tutorials/video-scripts/print-queue-management-audio-script.md`
- `05-tutorials/video-scripts/print-queue-management-storyboard-design-prompt.md`
- Topic logged in `05-tutorials/topic-backlog.md` (status: scripted)
